Migration rate, m (proportion)
1
0.01
0.0001
0.000001
Gene flow swamps local adaptation
m = s (a proportion)
Drift held in check;
local adaptation persists
10 migrants
per generation
$F_{ST} \approx 0.02$
$N_e m = 1$ (a number): $F_{ST} \approx 0.2$
Starts at Ne = 1/s = 100: below that,
drift also overrides selection
Drift can fix different alleles
